

Currency Converter using Exchange Rate API

Objective

This project demonstrates how to convert one currency into another using the **Exchange Rate API**. The application retrieves the latest exchange rates and calculates the converted amount based on the user's input.

🔧 Technologies Used

-  Python
-  Requests Library
-  Exchange Rate API
-  Pandas

```
In [1]: import requests  
import pandas as pd
```

```
In [10]: from_currency = input("Enter From Currency (e.g., USD): ").upper()  
  
to_currency = input("Enter To Currency (e.g., INR): ").upper()  
  
amount = float(input("Enter Amount: "))
```

```
In [11]: url = f"https://open.er-api.com/v6/latest/{from_currency}"

response = requests.get(url)

data = response.json()
```

```
In [12]: currency_data = []

if data["result"] == "success":

    rate = data["rates"][to_currency]

    converted = round(amount * rate, 2)

    currency_data.append({
        "From Currency": from_currency,
        "To Currency": to_currency,
        "Amount": amount,
        "Exchange Rate": rate,
        "Converted Amount": converted,
        "Last Updated": data["time_last_update_utc"]
    })

else:

    print("Invalid Currency Code")
```

```
In [13]: df = pd.DataFrame(currency_data)

df
```

```
Out[13]:
```

	From Currency	To Currency	Amount	Exchange Rate	Converted Amount	Last Updated
0	USD	INR	100.0	96.241592	9624.16	Wed, 15 Jul 2026 00:02:32 +0000

```
In [14]: df.to_csv("currency_conversion.csv", index=False)

print("CSV File Saved Successfully.")
```

CSV File Saved Successfully.

Conclusion

Successfully converted the requested currency using the **Exchange Rate API**. The application fetched the latest exchange rate and calculated the converted amount accurately.

-  Source Currency
-  Target Currency
-  Exchange Rate
-  Converted Amount
-  Last Updated Time

The conversion details were organized into a **Pandas DataFrame** and exported as a **CSV file** for future reference and analysis.

Currency Converter API Project Completed Successfully!
