

Country Information using Countries API

Objective

This project demonstrates how to retrieve country information using the **CountriesNow API**. Users can enter a country name to view its available cities.

Technologies Used

-  Python
-  Requests Library
-  CountriesNow API
-  Pandas

```
In [1]: import requests
import pandas as pd
```

```
In [2]: country = input("Enter Country Name: ")
```

```
In [3]: url = "https://countriesnow.space/api/v0.1/countries"

response = requests.get(url)

data = response.json()
```

```
In [4]: country_data = []

if response.status_code == 200:
```

```

countries = data["data"]

found = False

for item in countries:

    if item["country"].lower() == country.lower():

        country_data.append({
            "Country": item["country"],
            "Cities": ", ".join(item["cities"][:15])
        })

        found = True
        break

if not found:
    print("Country not found.")

else:
    print("API Error")

```

In [5]: `df = pd.DataFrame(country_data)`

`df`

Out[5]:

	Country	Cities
0	India	Abdul, Adilabad, Adwani, Agartala, Agra, Ahmed...

In [6]: `df.to_csv("country_information.csv", index=False)`

`print("CSV File Saved Successfully.")`

CSV File Saved Successfully.

Conclusion

Successfully retrieved country information using the **CountriesNow API**. The application searched the requested country and displayed a list of its cities.

- 🌐 Country Name
- 🏙️ List of Cities
- 📊 Structured Data Output

The retrieved information was organized into a **Pandas DataFrame** and exported as a **CSV file** for future reference.

Country Information API Project Completed Successfully!
